ABSTRACT

This report brings together census data on low earning workers from 1964 to 1990 to provide information on changes over time in prevalence and on low earning worker characteristics. The report presents data from the Current Population Survey of 1965, 1970, 1975, 1980, 1985, 1990, and 1991 for workers with a year-round, full-time attachment to the labor force; for workers who actually worked year-round, full-time; and for year-round, full-time wage and salary workers. The concept of year-round, full-time attachment was developed especially for this study and includes persons who spent at least 50 weeks during the year at work or looking for work and who either worked 35 hours a week or more or worked fewer hours for non-voluntary reasons. Some of the highlights of the report are as follows: (1) there was a sharp rise between 1979 and 1990 in the proportion of year-round, full-time workers with low annual earnings; (2) using the attachment definition, 25.7 percent had low annual earnings in 1990; and (3) there was an increase in low earning workers in the past decade. The bulk of the document is composed of 10 tables presenting the data. Each of these 10 tables contains a variable at the bottom entitled "Year of School Completed," in which the subdivisions are: less than 12 years, 12 years, and 13 years and over. The appendixes contain another 12 tables as well as information on the use of the Consumer Price Index, technical notes, source and accuracy information, and facsimiles of questionnaires. (JB)

WORKERS WITH LOW EARNINGS: 1964 to 1990

INTRODUCTION

A number of studies have pointed to recent increases in earnings inequality and in the number of workers with low earnings. To cite a few of the studies, Danziger and Acs (1990) found that the percentage of male workers between the ages of 25 and 54 with earnings less than \$12,000 (in 1987 CPI-X1 constant dollars) was higher in 1987 than in 1973. The 1973 rates for Whites, Blacks, and Hispanic origin males were 8.4, 24.9, and 19.6, respectively. The comparable 1987 rates were 13.2, 33.0, and 33.9. Bluestone and Harrison (1990) examined trends in low and high wages among year-round, full-time workers between 1963 and 1986 and found a sharp decline in the proportion of workers with low wages between 1963 and 1970, a period of relative stability between 1970 and 1979, and a rapid increase between 1979 and 1986. Finally, Ryscavage and Henle (1990) found that earnings inequality during the 1980's had "accelerated among male and female full-time, year-round workers and had increased among Whites, Black men, Hispanics, and workers in various occupations and industries." This report brings together data from the March supplements to the Current Population Surveys (CPS) of 1965, 1970, 1975, 1980, 1985, 1990 and 1991, to provide information on the number of workers with low earnings, on changes over time in the prevalence of low earnings, and on the characteristics of workers with low earnings.

The economic well-being of most persons in the U.S. economy depends on their own earnings or on the earnings of other family members. In 1990, based on data from the March 1991 CPS, earnings accounted for 79.4 percent of aggregate income.

Several studies of low wages and earnings inequality were cited above, but both the Bureau of Labor Statistics and the Bureau of the Census regularly produce data on average earnings. These data show declines in average earnings during the past decade. Data from the Bureau of the Census (the most recent data are published in *Money Income of Households, Families, and Persons in the United States: 1990*, Series P-60, No. 174) show that the median earnings of civilian male year-round, full-time workers declined from \$29,558 in 1980 to \$27,866 in 1990 (in 1990 CPI-U-X1 dollars). Data from the Bureau of Labor Statistics (the most recent data are published in the January 1991 issue of *Employment and Earnings*) show that the average weekly

earnings in private nonagricultural industries declined from \$373 in 1980 to \$346 in 1990 (in 1990 CPI-U-X1 dollars).

The level of wages has important implications for living standards and labor force participation and may have important effects on social behavior. At some point, low wages can result in poverty for the worker and the worker's family. But even if the income of the worker remains above the poverty threshold, low wages may make it difficult to pay for basic services like housing, education, and medical care. Low wages and the prospect of low wages can affect labor force behavior and social behavior. The exact response to low wages depends on the values and preferences of the worker. For some workers, the prospect of low wages may lead to a decision to stay out of the labor force if other sources of income (e.g., assistance payments) are available. For others, low wages may lead to increased hours of work. Finally, low wages affect social behavior in terms of the affordability of marrying, having children, and establishing an independent household.

In this report, workers have low earnings if their annual earnings are less than the poverty level for a four-person family. The choice of a low earnings threshold is necessarily subjective, but it might be argued that it would be a desirable goal to reach a point at which every full-time worker (with the possible exception of those just starting their work careers) had an earnings level sufficient to maintain a family above the poverty level.

The low earnings thresholds that are used in this report are shown in table A, expressed both as an annual level and as the hourly rate that would have to be earned by someone who worked 40 hours a week for 50 weeks. The changes over time in the thresholds reflect price movements. The 1990 threshold of \$12,195 and the 1964 threshold of \$3,144 are actually equal in constant dollars. The price index used to adjust the thresholds is CPI-U-X1, the experimental series that shows a slower price rise than the CPI-U index. Use of the latter index would make the thresholds higher for later years and would increase the number of low-earner workers. For additional information about the price indexes, see appendix A.

This report presents data for all workers, for workers with a year-round, full-time attachment to the labor force, for workers who actually worked year-round, full-time, and for year-round, full-time wage and salary

Table A. Low Earnings Thresholds: 1964, 1969, 1974, 1979, 1984, 1989, and 1990

Year	Threshold for low annual earnings	Corresponding hourly rate for person working 40 hours a week for 50 weeks
1964.....	\$3,144	\$1.57
1969.....	3,676	1.84
1974.....	4,843	2.42
1979.....	6,905	3.45
1984.....	9,694	4.85
1989.....	11,570	5.79
1990.....	12,195	6.10

workers. Within each of these work experience categories, persons are classified as having low earnings if their annual earnings are less than the threshold. The concept of low annual earnings has little value for classifying workers who are not strongly attached to the labor force, and the focus of this report will be on those who are strongly attached.

The concept of year-round, full-time attachment was developed especially for this study. The category includes persons who spent at least 50 weeks during the year at work or looking for work and who either worked 35 hours a week or more or worked fewer hours for nonvoluntary reasons.

The earnings concept used in the March supplement to the CPS is money compensation before any deductions. The data in this report, therefore, do not reflect the value of noncash benefits, nor do they reflect deductions for income and payroll taxes. Nonwage compensation in the form of "other labor income" has grown considerably over the years, from 4.7 percent of total compensation in 1964 to 10.0 percent in 1990. Not all of other labor income is immediately available to the worker. Some (about 13.5 percent of other labor income in 1990) is in the form of employer contributions to unemployment compensation and workers' compensation plans, and some is employer contributions to pension and retirement plans (19.2 percent of other labor income in 1990).¹ Note also that nonwage compensation varies by wage level. In 1987, for example, the percent of workers who received subsidized health insurance was 32.3 percent among year-round, full-time workers with earnings below \$10,000 and 83.9 percent among those with earnings between \$25,000 and \$34,999.²

HIGHLIGHTS

- There was a sharp rise between 1979 and 1990 in the proportion of year-round, full-time workers with low annual earnings. The rate rose from 12.1 (± 0.3)

percent in 1979 to 14.6 (± 0.3) percent in 1984, to 16.3 (± 0.3) percent in 1989, and 18.0 (± 0.3) percent in 1990.

- When the worker universe is defined to be persons with a year-round, full-time attachment to the labor force, 25.7 (± 0.4) percent had low annual earnings in 1990, higher than the 1989 figure of 23.1 (± 0.3) percent, and well above the 1979 figure of 18.9 (± 0.3) percent.
- The increase during the past decade in the proportion of year-round, full-time workers with low annual earnings contrasts with a steep decline from 1964 to 1969 and a further decline from 1969 to 1974. The proportions were 24.1 (± 0.5) percent in 1964, 14.4 (± 0.3) percent in 1969, and 12.0 (± 0.3) percent in 1974.
- In absolute terms, 14.4 (± 0.3) million year-round, full-time workers had low annual earnings in 1990. This compares to 10.3 (± 0.2) million in 1984, 7.8 (± 0.2) million in 1979, and 6.6 (± 0.2) million in 1974.
- The number of workers with a year-round, full-time attachment to the labor force and with low annual earnings was 24.3 (± 0.4) million in 1990, 20.0 (± 0.3) million in 1984, and 14.4 (± 0.3) million in 1979.
- There is a high probability that a year-round, full-time worker in the 18 to 24 years of age group will have low annual earnings. In 1990, 39.7 (± 1.9) percent of males and 48.1 (± 2.3) percent of females in this age group had low annual earnings. These figures represent very large increases over the 1979 figures of 18.1 (± 1.2) percent (males) and 29.4 (± 1.7) percent (females).
- In 1990, male year-round, full-time workers were much less likely than their female counterparts to have low annual earnings, but the likelihood of having low earnings has risen faster among males than among females during the past decade. The rate among males was 7.7 (± 0.3) percent in 1979 and 13.9 (± 0.4) percent in 1990. Among females, the rate was 20.4 (± 0.6) percent in 1979 and 24.3 (± 0.6) percent in 1990.
- In 1990, among sex, race, and Hispanic origin groups, White male year-round, full-time workers had the lowest rate of low earnings at 13.0 (± 0.4) percent. The rates among other groups were 22.4 (± 1.7) percent among Black males, 28.2 (± 2.0) percent among Hispanic origin males, 23.6 (± 0.6) percent among White females, 28.5 (± 1.9) percent among Black females, and 37.0 (± 2.8) percent among Hispanic origin females.³

¹Data from the Survey of Current Business, Bureau of Economic Analysis.

²Unpublished data from the Bureau of the Census.

³The rates were not statistically different between Black males and White females nor between Hispanic origin males and Black females.

- The likelihood of a year-round, full-time worker having low annual earnings has increased sharply within education categories. In 1990, 36.1 (± 1.3) percent of those with less than 12 years of schooling, 21.6 (± 0.6) percent of those with exactly 12 years of schooling, and 10.5 (± 0.4) percent of those with one or more years of college had low annual earnings. The comparable 1979 figures were 21.3 (± 0.9), 13.0 (± 0.5), and 6.2, (± 0.4) respectively.

NUMBER AND PERCENT OF WORKERS WITH LOW EARNINGS

In 1964, nearly one-fourth of the nation's year-round, full-time workers had low annual earnings (see table B). The difference between the sexes was large; the rate among males was 16.5 percent and the rate among females was 45.2 percent.

By 1969, the rates were sharply lower. The 1969 rate among all year-round, full-time workers was 14.4 percent, the rate among men was 8.8 percent, and the rate among women was 27.6 percent.

There was a further decline from 1969 to 1974. By the end of that period, the rate of low earnings among

year-round, full-time workers stood at 12.0 percent for both sexes, 7.4 percent for males, and 22.1 percent for females.

From 1974 to 1979, there was an additional decline in the prevalence of low earnings among female year-round, full-time workers, but the rate among men did not change significantly.

The recent rise in the prevalence of low earnings dates from 1979. Over the 1979 to 1990 period, the rate among men rose from 7.7 percent to 13.9 percent, the rate among women rose from 20.4 percent to 24.3 percent, and the rate among both sexes rose from 12.1 percent to 18.0 percent.

The 1990 figure of 14.4 million year-round, full-time workers with low annual earnings is higher than the figure for any of the other years included in this study. The number was 11.2 million in 1964, 7.6 million in 1969, 6.6 million in 1974 (the lowest level), 7.8 million in 1979 (not statistically different from the 1969 figure), and 10.3 million in 1984. The growth in absolute number reflects, in part, the growth in the number of workers. The prevalence rate of low earnings (the proportion of workers with low annual earnings) was 24.1 percent in 1964, 14.4 percent in 1969, 12.0 percent in 1974, 12.1

Table B. **Workers With Low Annual Earnings, by Work Experience and Sex: 1964, 1969, 1974, 1979, 1984, 1989, and 1990**

Year-round, full-time worker	45.2	27.6	22.1	20.4	21.3	22.8	24.3
Wage and salary worker	40.9	25.1	19.8	18.5	19.6	21.3	22.8

percent in 1979, 14.6 percent in 1984, 16.3 percent in 1989, and 18.0 percent in 1990 (neither the 1974 and 1979 figures nor the 1969 and 1984 figures are statistically different from each other).

Changes in the prevalence of low earnings are apparently caused by structural or long-term factors rather than cyclical factors. For example, the annual average civilian unemployment rate as published in the Monthly Labor Review for the years included in the study was 5.2 percent in 1964, 3.5 percent in 1969, 5.6 percent in 1974, 5.8 percent in 1979, 7.5 percent in 1984, 5.3 percent in 1989, and 5.5 percent in 1990. Comparisons between 1984 and 1990 show an increase in the prevalence of low earnings among year-round, full-time workers but a decrease in the unemployment rate.

LOW EARNINGS STATUS BY CHARACTERISTICS

Age

In 1990, workers in the 18 to 24 years-of-age group were much more likely than persons in other age groups to have low annual earnings. (See table C.) The rate of low earnings was 39.7 percent among males in this age group and 48.1 percent among females.

Males 35 to 54 made up the group with the lowest prevalence of low earnings, 8.9 percent. Females in this age group had a rate of 19.6 percent.

The prevalence relationships among various age and sex groups have changed somewhat over time. A comparison of 1974 rates with 1990 rates, for example, shows large positive differences among the four male age groups less than 65 years of age, but a negative difference for males 65 years old and over. A similar comparison among female age groups shows a large positive difference in the likelihood of low earnings among women 18 to 24, a positive difference among women 25 to 34, a negative difference among women 35 to 54, and no statistically significant difference for the older age groups.

Race and Hispanic Origin by Sex

In 1990, among workers classified by race, ethnicity, and sex, White males had the lowest probability of receiving low annual earnings. White females had a lower probability of having low annual earnings than Black or Hispanic origin females and also had a lower probability than Hispanic origin males. (See table D.)

The low earnings rate among White males was lower in 1990 than in 1964, but the 1990 rate was well above the rate of 1974. The rate for the years noted were 14.7 percent (1964), 6.9 percent (1974), and 13.0 percent (1990).

There is a similar pattern among Black males. The low earnings rates were 38.0 in 1964, 13.8 percent in 1974, and 22.4 percent in 1990.

Table C. Year-Round, Full-Time Workers With Low Annual Earnings, by Age and Sex: 1964, 1969, 1974, 1979, 1984, 1989, and 1990

Hispanic origin ¹	(NA)	(NA)	32.6	32.2	30.7	33.6	37.0

¹Persons of Hispanic origin may be of any race.

The low earnings rate among male Hispanic origin year-round, full-time workers was 28.2 percent in 1990, much higher than the 1974 rate of 12.1 percent.

In 1990, the percentage of White and Black females with low annual earnings was far below the 1964 rates, but higher than the 1979 rates. The low earnings rate among White females was 42.4 percent in 1964, 19.8 percent in 1979, and 23.6 percent in 1990. Comparable figures among Black females were 69.6 percent in 1964, 24.3 percent in 1979, and 28.5 percent in 1990.

Household Relationship

The data in table E show that, among year-round, full-time workers, husbands in married couple families have the smallest likelihood of receiving low annual earnings. Wives are much more likely to have low earnings as are female family householders not living with a spouse. Unrelated individuals have rates higher than husbands but lower than wives, and female unrelated individuals are more likely to have low annual earnings than male unrelated individuals.

Table E shows that the proportion of workers with low annual earnings in 1990 was 9.1 percent among husbands, 22.7 percent among wives, 23.4 percent among female family householders not living with a spouse (not statistically different from the figure for wives), 20.2 percent among female unrelated individuals, and 17.4 percent among male unrelated individuals.

Years of School Completed

Table F shows the proportion of year-round, full-time workers with low annual earnings by educational attainment (years of school completed). Data for 1964 were not available from the files used for this report.

Comparisons of 1979 and 1990 data show a strong shift upward in the likelihood that a person in one of the three years-of-schooling categories would be receiving

low annual earnings. In 1979, persons without a high school diploma had a low earnings rate of 21.3 percent; in 1990, the rate was 36.1 percent. Over the same period, the rate for persons with a high school diploma but no college rose from 13.0 to 21.6 percent, and the rate for persons with 1 or more years of college rose from 6.2 to 10.5 percent.

There are some differences among race and ethnic groups within the education categories. In 1990 for example, Hispanic origin and Black high school graduates had a higher likelihood of having low earnings than White high school graduates.

Distribution of Persons with Low Annual Earnings by Selected Characteristics

In 1990, 46.7 percent of the persons 16 years of age or older who worked year-round, full-time but had low annual earnings were male, 51.9 percent were under 35 years of age, and 82.0 percent were White. Among those 16 to 64 years of age, 77.1 percent had completed high school, and 48.4 percent were husbands or wives in a married-couple family. (See table G.)

Note the differences when the 1979 distribution of persons with low earnings is compared with the 1990 distributions. The proportion of males and the proportion of persons under 35 years of age were both higher in 1990 than in 1979. The proportion of workers with low earnings who were of Hispanic origin increased quite sharply over the period, from 7.7 percent in 1979 to 12.5 percent in 1990 (during this period, the proportion of year-round, full-time who were workers of Hispanic origin increased from 4.7 percent to 7.2 percent).

Data for the 16 to 64 years-of-age universe show that the likelihood that a worker with low earnings had completed high school was higher in 1990 than in 1979 (77.1 percent versus 67.6 percent). There was a decreased likelihood that such a worker was a husband or wife (55.3 percent in 1979 and 48.4 percent in 1990).

NOTE: Data for 1964 not available.

Poverty Rates

Most year-round, full-time workers with low annual earnings are not in poverty. A worker with low earnings will not be in poverty if the worker's total family income exceeds the appropriate poverty threshold. One example of this situation is a worker who earns less than the low earnings threshold but who falls above the poverty threshold because the earnings of another family member are enough to bring the total family income above the poverty threshold. Another example is an unrelated individual whose earnings are below the low earnings threshold but above the poverty threshold.

In 1990, the poverty rate among workers 16 to 64 years of age with low earnings was 12.9 percent (table H).

The likelihood of a worker with low earnings being in poverty varies somewhat by family relationship. In 1990, 21.4 percent of husbands with low earnings were in poverty, but the poverty rate among wives with low earnings was only 5.5 percent. The difference reflects the greater labor force attachment of husbands; in 1990, 75.3 percent of husbands and 38.0 percent of wives were workers. Women with low earnings and without husbands were more likely to be in poverty than wives with low earnings. In 1990, the poverty rate was 27.8 percent among female family householders with no spouse present and with low earnings and 14.1 percent among female unrelated individuals with low earnings (the latter figure was not statistically different from the overall rate of 12.9 percent).

CONCLUSIONS

Wage rates have a direct effect on living standards and can affect labor force and social behavior. Declining wage rates can be a source of economic and social stress. The data in this report show a sharp increase over the past decade in the likelihood that a year-round, full-time worker (or a worker with a year-round, full-time attachment to the labor force) will have low annual earnings. In 1979, 7.8 million or 12.1 percent of all year-round, full-time workers had low annual earnings. By 1990, the number of year-round, full-time workers with low annual earnings was 14.4 million and the proportion was 18.0 percent.

Young workers have the highest likelihood of receiving low earnings (the rate in 1990 was 43.4 percent among year-round, full-time workers between the ages of 18 and 24) but the rate has increased since 1979 for all age groups below 65 years of age.

The importance of wage rates is widely appreciated and both the Bureau of Labor Statistics and the Bureau of the Census regularly report on levels and trends in average or median earnings. This report was developed and presented in the interest of providing additional information about the distribution of earnings and trends in that distribution.

Appendix A. Bureau of Labor Statistics' Statement on Use of CPI-U-X1

The Bureau of Labor Statistics (BLS) developed an experimental Consumer Price Index (CPI-U-X1) for researchers who wish to make historical comparisons with the current Consumer Price Index for All Urban Consumers (CPI-U) which uses the rental equivalence approach to measuring shelter services. Prior to 1983, the measurement of homeowner costs included changes in the asset value of homes. Recognizing that this approach mixed the investment and consumption aspects of homeownership, the BLS initiated an extensive research effort in the early 1970's to develop a better methodology. Following extensive study and testing, the CPI-U was officially converted to a rental equivalence measure in 1983. This rental equivalent approach is a methodology that isolates the shelter services component and, therefore, is a superior measure.

When the new methodology was introduced, the historical series were not revised. Price indexes are used for escalation and other contractual purposes that

require the parties to agree on one official series. Moreover, the BLS did not have the basic data or the resources to convert all of its historical series (including local area indexes) to the new methodology. The refinements that were ultimately developed before the methodology was officially introduced into the CPI—notably a larger sample of renters and a reweighting of the shelter component—could not be incorporated into the CPI-U-X1. Nonetheless, for many purposes the CPI-U-X1 can serve as an adequate proxy for what the national index would have been using the rental equivalence measure. Therefore, BLS recommends the use of the CPI-U-X1 to those who need to use a CPI series that treats homeowner costs consistently over time.

Appendix B. Definitions, Explanations, and Comparability of Data

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian noninstitutional population of the United States and members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of Armed Forces.

Income. For each person in the sample 15 years old and over, questions were asked on the amount of money income received in the preceding calendar year from each of the following sources: 1) earnings from longest job (or self-employment); 2) earnings from jobs other than longest job; 3) unemployment compensation; 4) worker's compensation; 5) Social Security; 6) Supplemental Security income; 7) public assistance; 8) veterans' payments; 9) survivor benefits; 10) disability benefits; 11) retirement pensions; 12) interest; 13) dividends; 14) rents and royalties or estates and trusts; 15) educational assistance; 16) alimony; 17) child support; 18) financial assistance from outside of the household, and other periodic income.

It should be noted that although the income statistics refer to receipts during the preceding calendar year, the demographic characteristics such as age, labor force status, and family or household composition are as of the survey date. The income of the family/household does not include amounts received by persons who were members during all or part of the income year if these persons no longer resided in the family/household at the time of interview. However, income data are collected for persons who are current residents but did not reside in the household during the income year.

Data on consumer income collected in the CPS by the Bureau of the Census cover money income received (exclusive of certain money receipts such as capital gains) before payments for personal income taxes, Social Security, union dues, Medicare deductions, etc. Therefore, money income does not reflect the fact that some families receive part of their income in the form of noncash benefits such as food stamps, health benefits, noncash benefits in the form of rent-free housing and goods produced and consumed on the farm; or that non-cash benefits are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should

be considered when comparing income levels. Moreover, readers should be aware that for many different reasons there is a tendency in household surveys for respondents to underreport their income. From an analysis of independently derived income estimates, it has been determined that income earned from wages or salaries is much better reported than other sources of income, and is nearly equal to independent estimates of aggregate income.

The various sources for which income is reported are defined as follows:

Longest job and other employment earnings can be classified into the three types:

1. *Money wage or salary income* is the total received for work performed as an employee during the income year. It includes wages, salary, Armed Forces pay, commissions, tips, piece rate payments, and cash bonuses earned, before deductions were made for taxes, bonds, pensions, union dues, etc.
2. *Net income from nonfarm self-employment* is the net money income (gross receipts minus expenses) from one's own business, professional enterprise, or partnership. Gross receipts include the value of all goods sold and services rendered. Expenses include costs of goods purchased, rent, heat, light, power, depreciation charges, wages and salaries paid, business taxes (not personal income taxes), etc. In general, inventory changes were considered in determining net income; replies based on income tax returns or other official records do reflect inventory changes. However, when values of inventory changes were not reported, net income figures exclusive of inventory changes were accepted. The value of saleable merchandise consumed by the proprietors of retail stores is not included as part of net income.
3. *Net income from farm self-employment* is the net money income (gross receipts minus operating expenses) from the operation of a farm by a person on his own account, as an owner, renter, or share-cropper. Gross receipts include the value of all products sold, government farm programs, money received from the rental of farm equipment to others, rent received from farm property if payment is made based on a percent of crops produced and incidental receipts from the sale of wood, sand,

gravel, etc. Operating expenses include cost of feed, fertilizer, seed, and other farming supplies, cash wages paid to farmhands, depreciation charges, cash rent, interest on farm mortgages, farm building repairs, farm taxes (not State and Federal personal income taxes), etc. The value of fuel, food, or other farm products used for family living is not included as part of net income. In general, inventory changes were considered in determining net income only when they were accounted for in replies based on income tax returns or other official records which reflect inventory changes; otherwise, inventory changes were not taken into account.

Unemployment compensation includes payments received from government unemployment agencies or private companies during periods of unemployment and any strike benefits received from union funds.

Workers compensation includes payments received periodically from public or private insurance companies for injuries received at work.

Social Security includes Social Security pensions and survivors' benefits, and permanent disability insurance payments made by the Social Security Administration prior to deductions for medical insurance. Medicare reimbursements are not included.

Supplemental Security income includes payments made by Federal, State, and local welfare agencies to low income persons who are (1) 65 years old or over, (2) blind, or (3) disabled.

Public assistance or welfare payments include public assistance payments made to low income persons, such as aid to families with dependent children and general assistance.

Veterans' payments include payments made periodically by the Department of Veterans Affairs to disabled members of the Armed Forces or to survivors of deceased veterans for education and on-the-job training, and means-tested assistance to veterans.

Survivor benefits include payments from survivor or widows' pensions, estates, trusts, annuities, or any other types of survivor benefits. Payments can be reported from 10 different sources: 1) private companies or unions; 2) Federal government (Civil Service); 3) military; 4) state or local governments; 5) railroad retirement; 6) workers' compensation; 7) Black lung payments; 8) estates and trusts; 9) annuities or paid-up insurance policies; and 10) other survivor payments.

Disability benefits include all payments received as a result of a health problem or disability. Payments can be reported from 10 sources: 1) workers' compensation; 2)

companies or unions; 3) Federal government (Civil Service); 4) U.S. Military; 5) state or local governments; 6) railroad retirement; 7) accident or disability insurance; 8) Black lung payments; 9) state temporary sickness; or 10) other disability payments.

Retirement benefits include payments reported from 8 sources: 1) companies or unions; 2) Federal government (Civil Service); 3) U.S. Military; 4) state or local governments; 5) railroad retirement; 6) annuities or paid-up insurance policies; 7) IRA or KEOGH payments; or 8) other retirement income.

Interest income includes payments received or credited to: savings accounts, bonds, treasury notes, IRA's, certificates of deposit, interest-bearing checking accounts, and all open investments that pay interest.

Dividends include income received from stockholdings and mutual fund shares. Capital gains from the sale of stockholdings are not included as dividends.

Rents, royalties, and estates and trusts include the net income from the rental of a house, store, or other property, receipts from boarders or lodgers, net royalty income, and periodic payments from estate or trust funds.

Educational assistance includes Pell Grants, other government educational assistance, any scholarships or grants, or financial assistance from employers, friends, or relatives not residing in the students household.

Child support includes all periodic payments paid by parents for the support of children, even if these payments are made through a state or local government office.

Alimony includes all periodic payments to ex-spouses. One-time property settlements are not included.

Financial assistance from outside of the household includes periodic payments from nonhousehold members. Gifts or sporadic assistance are not included.

Government transfers include payments from the following sources: 1) Unemployment compensation, 2) State workers compensation, 3) Social Security, 4) Supplemental Security Income (SSI), 5) Public assistance, 6) Veterans' benefits, 7) government survivor benefits, 8) government disability benefits, 9) government pensions, and 10) government educational assistance.

Other income includes all other regularly received payments that are not included elsewhere on the questionnaire. Some examples include: state programs such as foster child payments, military family allotments, income received from foreign government pensions, etc.

Receipts not counted as income include: (1) capital gains such as money received from the sale of property, such as stocks, bonds, a house, or a car (unless the person was engaged in the business of selling such property, in which case the net proceeds would be counted as income from self-employment); (2) withdrawals of bank deposits; (3) money borrowed; (4) tax refunds; (5) gifts; and (6) lump-sum inheritances or insurance payments.

All sources of income may be combined into two major types:

Total money earnings is the algebraic sum of money wages and salary and net income from farm and non-farm self-employment.

Income other than earnings is the algebraic sum of all sources of money income except wages and salaries and income from self employment.

Low annual earnings. The choice of a threshold for determining whether annual earnings are low or not low is necessarily subjective. The decision to adopt the poverty line for a four person family with two children as the low earnings threshold was based in part on the "ideal" that a year-round, full-time worker could support a family above the poverty line and in part on other studies that have used thresholds of approximately the same level (in particular the 1990 study by Danziger and Acs and a 1969 Census Bureau report by Florence F. Einhorn, *Year-Round Workers with Low Earnings in 1966*, Series P-60, No. 58).

Because some analysts have argued that the CPI-U series overstates the rate of inflation, the study uses the CPI-U-X1 series to calculate constant dollar thresholds. Use of the CPI-U series would result in higher estimates of the number of year-round, full-time workers with low annual earnings. The estimate for 1989 based on CPI-U, for example, is 16.0 million, 3 million higher than the estimate of 13.0 million in this report.

A worker was classified as having low annual earnings in a given year if the worker's earnings fell below the low earnings threshold for that year. The threshold levels are shown in table A of this report.

Although this study uses the CPI-U-X1 series to adjust the low earnings thresholds for price changes over time, the Census Bureau uses the CPI-U series to adjust poverty thresholds over time. The poverty data in this report, therefore, are based on CPI-U thresholds and are consistent with other Census Bureau data on poverty.

Poverty definition. Poverty statistics presented in this report are based on a definition developed by the Social Security Administration in 1964 and revised in 1969 and 1981 by interagency committees. This definition was

established as the official definition of poverty for statistical use in all Executive departments by the Bureau of the Budget (in Circular No. A-46) and later by the Office of Management and Budget (in Statistical Directive No. 14).

The original poverty index provided a range of income cutoffs adjusted by such factors as family size, sex of the family head, number of children under 18 years old, and farm-nonfarm residence. At the core of this definition of poverty was the economy food plan, the least costly of four nutritionally adequate food plans designed by the Department of Agriculture. It was determined from the Department of Agriculture's 1955 survey of food consumption that families of three or more persons spent approximately one-third of their income on food; the poverty level for these families was, therefore, set at three times the cost of the economy food plan. For smaller families and persons living alone, the cost of the economy food plan was multiplied by factors that were slightly higher in order to compensate for the relatively larger fixed expenses of these smaller households. Annual revisions of these SSA poverty cutoffs were based on price changes of the items in the economy food budget.

As a result of deliberations of a Federal Interagency Committee in 1969, the following two modifications to the original SSA definition of poverty were recommended: (1) that the SSA thresholds for nonfarm families be retained for the base year 1963, but that annual adjustments in the levels be based on changes in the Consumer Price Index (CPI) rather than on changes in the cost of food included in the economy food plan; and (2) that the farm thresholds be raised from 70 to 85 percent of the corresponding nonfarm levels. The combined impact of these two modifications resulted in an increase of 360,000 poor families and 1.6 million poor persons in 1967.

In 1980, another interagency committee recommended three additional modifications that were implemented in the March 1982 CPS as well as the 1980 census: (1) elimination of separate thresholds for farm families, (2) averaging of thresholds for female-householder and "all other" families, and (3) extension of the poverty matrix to families with nine or more members. For further details, see the section, "Changes in the Definition of Poverty," in Current Population Reports, Series P-60, No. 133.

Table B-1 shows the full poverty threshold matrix in 1990.

Households. Households consist of all persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

Table B-1. Poverty Thresholds in 1990, by Size of Family and Number of Related Children Under 18 Years

Size of family unit	Weighted average thresholds	Related children under 18 years							
		None	One	Two	Three	Four	Five	Six	Seven or more
One person (unrelated individual) . . .	\$ 6,652								
Under 65 years	6,800	6,800							
65 years and over	6,268	6,268							
Two persons	8,509								
Householder under 65 years	8,794	8,752	9,009						
Householder 65 years and over . . .	7,905	7,900	8,975						
Three persons	10,419	10,223	10,520	10,530					
Four persons	13,359	13,481	13,701	13,254	\$13,301				
Five persons	15,792	16,257	16,494	15,989	15,598	\$15,359			
Six persons	17,839	18,693	18,773	18,386	18,015	17,484	\$17,137		
Seven persons	20,241	21,515	21,650	21,187	20,864	20,262	19,561	\$18,791	
Eight persons	22,582	24,063	24,276	23,839	23,456	22,913	22,223	21,505	\$21,323
Nine persons or more	26,848	28,946	29,087	28,700	28,375	27,842	27,108	26,445	26,280 \$25,268

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. Group quarters contain five or more persons unrelated to the person in charge, such as residents of lodging and boarding houses. All persons who are not members of households are regarded as living in group quarters. Persons living in military barracks and inmates of institutions were excluded from the survey.

Householder. The person (or one of the persons) in whose name the home is owned or rented. If the house is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of the other household members is recorded. One person in each household is designated as the "householder." The number of householders, therefore, is equal to the number of households.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

Families. Families are groups of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) were no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family households. Family households are households maintained by a family (as defined above). Members of family households include any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of family.)

Unrelated subfamilies. Formerly called secondary families, unrelated subfamilies include two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. An unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960)

the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Married couples. As defined for census purposes, married couples consist of a husband and wife enumerated as members of the same family household. A married couple may or may not have children living with them.

Unrelated individuals. These are persons (other than inmates of institutions) who are not living with any relatives. An unrelated individual may (1) constitute a one-person household, (2) be part of a household including one or more other families or unrelated individuals, or (3) reside in group quarters such as a rooming house. Thus, a widow living by herself or with one or more other persons not related to her, a lodger not related to the householder or to anyone else in the household, and a servant living in an employer's household with no relatives are examples of unrelated individuals.

Nonfamily householders. Formerly called primary individuals, nonfamily householders are persons maintaining a household while living alone or with nonrelatives only.

Secondary individuals. Secondary individuals are persons in households or group quarters such as guests, roomers, boarders, or resident employees (excluding nonfamily householders and inmates of institutions) who are not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

Related children under 18 years of age. In a family, related children under 18 years of age include sons and daughters, including stepchildren and adopted children, of the householder and all other children in the household who are related to the householder by blood, marriage, or adoption.

Age. This classification is based on the age of the person at his last birthday.

Race. Race is based on five groups: (1) White, (2) Black, (3) Asian or Pacific Islander, (4) American Indian, Aleut, or Eskimo, and (5) other.

Hispanic origin. Persons of Hispanic origin are identified by a question that asks for self-identification of the person's origin or descent. Respondents are asked to select their origin (and the origin of other household members) from a "flash card" listing ethnic origins. Persons of Hispanic origin, in particular, are those who

indicate that their origin is Mexican, Puerto Rican, Cuban, Central or South American, or some other Hispanic origin. It should be noted that persons of Hispanic origin may be of any race.

Years of school completed. Data on years of school completed are derived from the combination of answers to questions concerning the highest grade of school attended by the person and whether or not that grade was finished. The questions of educational attainment apply only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior), colleges, universities, and professional schools (whether day schools or night schools). Thus, regular schooling is that which may advance a person toward an elementary school certificate, a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools is counted only if the credits obtained are regarded as transferable to schools in the regular school system. The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Occupation. Occupation data in this report refer to the job held longest during the income year. The occupation groupings were derived from occupation subgroups delineated on the basis of the classification system used in the 1980 census. For more detailed information, see the February 1983 issue of "Employment and Earnings," Bureau of Labor Statistics.

Work experience. Work experience is based on work for pay or profit or work without pay on a family-operated farm or business at any time during the previous year, on a part time or full time basis.

Weeks worked in the income year. This is based on the number of different weeks, during the preceding calendar year, in which a person did any work for pay or profit (including paid vacations and sick leave) or worked without pay on a family-operated farm or business.

Part-time or full-time employment. Defined as follows: part-time indicates less than 35 hours of work per week in a majority of the weeks worked during the year. Full-time indicates 35 hours or more per week during a majority of the weeks worked.

Year-round, full-time. Indicates 50 or more weeks of full-time employment during the previous calendar year.

Nonworkers. Nonworkers are persons who did not do any work in the calendar year preceding the survey.

Workers. Persons who worked one or more days during the previous calendar year.

Symbols. A dash (-) represents zero or rounds to zero, the symbol "B" means that the base for the derived figure is less than 75,000, the symbol "X" means not applicable, the symbol "NA" means not available, and the symbol "r" means revised.

Rounding. Percentages are rounded to the nearest tenth of a percent; therefore, the percentages in a distribution do not always add to exactly 100.0 percent. The totals, however, are always shown as 100.0. Moreover, individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Base figures. Since 1979, base figures are based on civilian noninstitutional population controls for age, race, and sex established by the 1980 census. The base figures shown for 1971 to 1978 were prepared by inflating weighted sample results to agree with independent estimates of the population based on statistics updated from the 1970 census, whereas the base figures for the years from 1961 to 1970 were inflated to estimates derived from the 1960 census. The data for the years prior to 1961 were based on the 1950 census.

COMPARABILITY OF CURRENT CPS ESTIMATES WITH THOSE FROM PREVIOUS YEARS

Estimates from the CPS are in some instances not strictly comparable with those from previous years due to several factors. Among these factors are changes in (1) population controls and metropolitan residence definitions; (2) collection of income and work experience data; (3) noninterviews, nonresponses, and allocations; (4) questionnaire wording and procedures; (5) sample size and interpolation procedures; and (6) definition of the income universe. Each of these factors is discussed in the following sections, and readers should consider these differences when comparing current with previous years' estimates.

Population Controls and Metropolitan Residence Definitions

In July 1985, the CPS began carrying the metropolitan statistical area definitions announced by the Office of Management and Budget on June 20, 1984. Figures

published from the CPS in the early 1980's and throughout most of the 1970's referred to metropolitan area as defined on the basis of the 1970 census. Since there are important differences in the population classified as metropolitan using the 1970 and 1984 definitions, comparisons should be avoided.

The data for 1971 through 1990 are in some instances not entirely comparable to figures for earlier years because of revisions in the Current Population Survey. The estimates for 1979 to 1990 are based on civilian noninstitutional population established by the 1980 census. Starting in January 1972, 1970 census-based population controls, metropolitan residence definitions, and other materials were introduced into the sample and estimation procedures. The major item affecting comparability at the overall national level is the introduction of population controls based on the 1970 census. The data for 1971 through 1978 are based on civilian noninstitutional population established by the 1970 census. Figures for previous years are tied in with 1960 census-based population controls. In a number of instances, data from the March 1970 and 1971 CPS's were revised to take account of 1970 census-based population controls, thus providing some measure of the impact of the changes. (See table 3, Current Population Reports, Series P-60, No. 91.) Basically, these changes should have no substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions and low-income or poverty rates. However, the changes may have more impact on the population levels in different subgroupings, such as the total number of persons or families either overall, within some particular income interval, or below the low-income level. A detailed description of these changes appears in the Bureau of Labor Statistics report, *Employment and Earnings*, Vol. 18, No. 8, February 1972.

Comparability of metropolitan and nonmetropolitan data from the March 1980 CPS with data for previous years. Changes in the CPS design and procedures made the annual series of sample population data for metropolitan and nonmetropolitan areas inconsistent. Analytic comparisons of year-to-year changes in these figures should be avoided. Trends in metropolitan and nonmetropolitan population growth over the 1970-83 period should not be appreciably affected by the procedural changes. The major revisions to earlier CPS sample design and estimation methods have involved the varying of the number of sample units. Incorporation of approximately 10,000 supplemental housing units into the March CPS sample in 1977 was accompanied by new procedures for inflating the sample results to reflect national estimates. It was determined subsequent to the introduction of the additional sample that the new inflating (weighting) procedures used for processing both the March 1977 and March 1978 CPS

supplement data had resulted in an apparent overestimate of the nonmetropolitan population and corresponding underestimate of the metropolitan population for those years. For the March 1979 CPS, another revision of the weighting process was introduced to correct the problem discovered in the earlier procedures. The result of this change was a large spurious increase in the metropolitan population and decrease in the nonmetropolitan population relative to March 1978 CPS levels.

Collection of Income and Work Experience Data

This report presents data showing income of persons and family householders with varying amounts of work experience. In the surveys from March 1966 to March 1969, civilian work experience data collected in the February and April surveys were matched with income data collected in the March survey for all households. In the Surveys prior to March 1966 only persons included in the February and March surveys were matched.

Nonmatched persons included in the February and March interviews or the March and April interviews were almost always assigned work experience information from actual respondents with similar economic and demographic characteristics. Work experience values were estimated only when there was a nonmatched person with a given classification, but no respondent with similar economic and demographic characteristics.

No April or February 1969 survey record could be found for about 6 percent of the people included in the March 1969 survey. The major reasons for these non-matches were migration, noninterviews, and coding errors. In order to eliminate the nonmatches and to improve the consistency between income and work experience data, both the income and work experience data were collected together beginning with the March 1970 survey.

The remaining persons, whose work experience data were assigned, resulted from inconsistencies between their work experience and income data and from persons who did not answer the work experience questions. It should be noted that the proportions of year-round, full-time workers shown in the Series P-60 reports differ slightly from those shown for the same subgroups in the Bureau of Labor Statistics, Special Labor Force Reports, *Work Experience of the Population*. The difference exists because the proportions are not based on exactly the same groups. The proportions presented in the Special Labor Force Reports relate to civilians who worked at some time during the year. In contrast, the proportions shown in the persons tables in the P-60 reports relate to civilians who received income, including not only workers but also many persons who did not work but received income from pensions, interest, dividends, or other sources aside from earnings.

Noninterviews, Nonresponses, and Allocations

In the March 1991 CPS, no interview was obtained for approximately 4.5 percent of the 60,000 households in the sample. No interview was obtained at these households during the enumeration week for reasons such as "no one home," "temporarily absent," or "refusals." In order to account for these households, the weights assigned to households in which interviews were obtained have been increased slightly. This "non-interview" adjustment procedure adjusts the weights of sample households by race of householder and within a specified set of geographical restrictions.

The nonresponse problem, which is sometimes referred to as "item nonresponse," is a serious problem in most household surveys and is especially troublesome for income. Even though an interview is obtained in many cases, complete information for all of the income questions is not available, unknown or refused. In March 1991, for example, an interview was not completed for approximately 8 percent of all income supplements. In order that the maximum amount of information can be utilized, missing income items are imputed or allocated by values which are obtained from active respondents with similar economic and demographic characteristics.

Questionnaire Wording and Procedures

Modifications in collecting income data in the March 1979 Current Population Survey. As part of the March 1979 CPS, the Bureau conducted an experiment in an effort to improve the reporting of income data. An alternative questionnaire was used on three of the eight rotation groups. The experimental questionnaire used more probing questions and inquired about more detailed sources of income. The results of the experiment and its subsequent impact on the estimates are discussed in the Current Population Reports, Series P-60, No. 123, page 12. Beginning in March of 1980, this new questionnaire was used for the full CPS sample; with few modifications, this questionnaire is still in use.

Definition of Income Universe

Starting in the March 1980 CPS, a decision was made to restrict the universe for presenting income data to persons 15 years old and over instead of 14 years old and over. This change was made to establish consistency between the results from the March 1980 CPS and the 1980 Census of Population. Although income data were collected for persons 14 years old and over, the income of the 14-year-olds was not used for processing and tabulation purposes.

The March 1980 CPS also incorporated the use of the "householder" concept rather than the traditional

"head" concept. Under the new procedure, the householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented.

Another change made in the March 1980 CPS was the exclusion of secondary families (now called unrelated subfamilies) from the count of all families. This modification was required because of the introduction of the householder concept, since unrelated subfamilies do not have a householder. For more discussion on all of these changes, see the section, "Modifications to the March 1980 CPS," Current Population Reports, Series P-60, No. 129.

REVISIONS TO MARCH 1989 CPS PROCESSING SYSTEM

Between 1988 and 1989 a new computer processing system was introduced for the March Current Population Survey. This processing system rewrite was long overdue; the system in use before this year was first introduced in March 1976 and was never fully updated to reflect the numerous questionnaire changes that have taken place since that time. In addition, the programs used to process the CPS files were written in a computer language that is being phased out of use at the Census Bureau.

Since the Census Bureau began imputing for missing income data on the CPS in 1962, there have been three major revisions to the processing system (in 1967, 1976, and 1989). Through all of these revisions, the basic strategy used to make imputations has remained the same. This approach, commonly referred to as "hot deck" imputation, assigns missing responses to sample persons with information from matched sample persons with similar demographic and economic information who answered these questions.

Under the new March processing system, there were three main modifications to the income imputation programs:

1. The edits and imputations were expanded to reflect the full detail of the March income questionnaire. The original processing system was still based on a less detailed CPS income questionnaire that has not been in use since 1980.
2. Under the revised processing procedures, entire sets of March income and noncash benefits data were imputed to supplement noninterviews from the same interviewed person. Under the original processing procedures, earnings, unearned income, and noncash benefits were imputed in separate stages during the processing system. Thus, the new processing system imputes noninterviews more efficiently and is better able to preserve the correlation between earnings, unearned income, and noncash benefits.
3. Both the old and new processing systems employ what are called "statistical matches" to link sample cases with reported data to those requiring imputation for missing responses. In the original processing system, under certain circumstances, reported data were removed and replaced with imputed data during the statistical matching process. Under the new system, reported data are never removed. This was accomplished by expanding the number of statistical matches in the income imputation system.

For details on the results of the revised processing procedures, see Current Population Reports, Series P-60, No. 166, *Money Income and Poverty Status in the United States: 1988*.

QUALITY OF INCOME DATA

The quality of the income data derived from the March Current Population Survey (CPS) is affected by five main sources of error. The first, sampling errors, are errors attributable to the fact that a sample rather than a census was taken. Discussion of these errors is included in appendix D of this report. The other four main sources of error, usually termed collectively as nonsampling errors, result from 1) use of a sampling frame that does not include all units for which the survey was intended to provide data, 2) failure to contact all sample units selected, i.e., noninterview and undercoverage problems, 3) poor quality of responses, and 4) missing data problems.

Over the years evaluations of the quality of the March CPS income estimates have revealed downward biases when the survey estimates are compared to independent estimates derived from sources such as the National Income and Product Accounts (NIPA), statistics based on Federal individual income tax returns, data from the Social Security Administration (SSA), etc.

Most analyses of the magnitude of nonsampling errors in the March CPS income estimates have been made at the "aggregate" level since the kind of data needed to make such comparisons are relatively easy to obtain. Some studies have also been conducted at the "micro" level by matching the data provided by individuals with data obtained from administrative records systems for those same individuals. These studies, such as the March 1973 CPS-IRS-SSA exact match, have shown that the nonsampling error problem is much more complex than that measured at the aggregate level. For example, a significant number of respondents provide responses to the amounts of income received that appear to exceed the actual amount received. These are offset by larger errors in the other direction by a somewhat higher proportion of other respondents.

Deriving independent estimates of aggregate income for purposes of evaluating the survey data is difficult. The survey and administrative sources use different

definitions, cover different universes, and are based on concepts that are not exactly the same. Therefore, adjustments to the administrative sources must be made to help correct for these inconsistencies and arrive at a valid independent estimate that can be used to make fair and accurate estimates of the quality of the survey estimates. These adjustments attempt to 1) remove income that is received by the institutional population, the deceased, and persons not residing in the United States at the time of the interview, 2) remove any components of income that are received as "in-kind" payments or benefits, and 3) remove any lump-sum or one-time payments, withdrawals, etc.

A degree of uncertainty must be attached to the independent estimates for several reasons. First, not all of the information needed to make some of these adjustments mentioned above are available. Second, administrative sources are also subject to estimation problems resulting from the lack of adequate data, and in the case of the NIPA, periodically undergo significant revision to correct for some of these errors when more recent or more accurate information become available. Third, even though attempts are made to include income received by those operating in the legal "informal" economy in the NIPA these estimates are subject to some unknown degree of error. Fourth, no attempt is made to include estimates of income received through illegal means.

In spite of this uncertainty regarding development of independent estimates it is important to attempt to monitor the quality of the income estimates using these sources. Table B-2 contains comparisons of survey and independent estimates of aggregate income by type of income for 1987. The estimates shown in this table are not directly comparable to those for 1983, which was the last year for which independent estimates were made. Major revisions to the NIPA and some revisions in the methods for arriving at the CPS concepts make most comparisons for these years inconsistent. Because of the difficulties in deriving adequate independent estimates, the table does not cover all types of income identified in the March CPS.

Overall, the survey estimate of \$2.941 trillion was about 89 percent of the independent estimate. This result is achieved mainly because the survey estimate of wage and salary income was 99 percent of the independent estimate and this income source accounts for 75 percent of the CPS income estimate from all sources. For the other sources of income the survey estimates range from 34 percent of the independent estimate for farm income to 99 percent for Federal government and military pensions.

The apparent extreme underreporting problem for farm income helps to illustrate the difficulty in developing meaningful independent estimates. The estimate of \$46.9 billion shown in table B-2 for farm income was derived directly from the NIPA which bases its estimates

on data from the United States Department of Agriculture. In contrast, farm income reported on Federal individual income tax returns for 1987 was only \$10.5 billion.

The CPS continues to have serious underreporting problems for property income (interest, dividends, net rent, and net royalty income) where the survey estimates range between 53 and 72 percent of the independent estimates.

Benefits from the means-tested programs, Aid to Families With Dependent Children (AFDC) and Supplemental Security Income (SSI) also exhibit significant survey underestimates at 73 and 83 percent of the independent estimates respectively. For these incomes, however, a significant portion of this problem is associated with misclassification of the source of income. In the CPS, AFDC benefits are often reported by survey respondents as having come from other sources of welfare payments, mainly General Assistance. Benefits from the SSI program are sometimes reported as Social Security income by respondents who do not know the true source of the benefit.

Benefits from the Veterans' Administration, unemployment compensation, and workers' compensation, all of which have a past history of significant underestimation in the March CPS, continue to have such a problem. Veterans' payments have also been shown to be subject to errors of misclassification with a significant proportion of these benefits being reported incorrectly by respondents as military retirement. The low reporting rate for workers' compensation may be in part related to significant levels of one-time, lump-sum settlements that are conceptually excluded from the survey's definition of income. Since no data are available that permit a precise adjustment to the independent estimate for the existence lump-sum payments, this figure may be overestimated. While undoubtedly some persons incorrectly report lump-sum amounts in the survey, resulting in an error in the opposite direction, these errors are thought to be much smaller.

Pension income estimates from the survey show a peculiar pattern of underreporting problems. For Federal and military pensions the survey estimate is about 99 percent of that derived from independent sources while for private pensions and annuities the survey estimate is only about 46 percent of the independent source. The high level of reporting indicated for Federal and military retirement may be overstated somewhat because of the misreporting problem that exists between military retirement and Veteran's payments. The extremely low level of reporting for private pensions may be, in part, due to a significant overestimate of the independent estimate. Since information concerning the prevalence of lump-sum payments is not available, adequate adjustments to exclude these types of payments have not been made.

Table B-2. Comparison of CPS Aggregate Money Income Concepts With Independent Estimates Adjusted to CPS Money Income Concepts, by Type of Income and Reported and Imputed CPS Amounts: 1987

Source of income	Independent source		CPS					
			Total		Reported		Imputed

¹Only includes estates and trusts reported as survivor benefits. Other estates and trusts are included with rent and royalty income.

Table B-3 has been included in this report to illustrate the wide variation between income estimates based on Federal individual income tax returns and the NIPA. The NIPA estimates adjusted to survey concepts (column 4 of table B-3) were used as the basis for the calculations in table B-2. In some cases these income amounts differ significantly from those shown in the other columns of table B-3. The first column labeled "IRS AGI as reported" represents the amounts as computed from unaudited Federal tax returns. The second column labeled "IRS AGI after TCMP adjustment" reflects adjustments made to the amounts shown in column 1 based on results of the Taxpayer Compliance Measurement Program (TCMP). This program, which performs extensive audits of a sample of tax returns every 3 years, provides estimates of the amount of income that should have been reported but was not reported for both tax filers and nonfilers that should have filed. Finally, the third column labeled "AGI after BEA reconciliation" are estimates of adjusted gross income (AGI) for Federal individual tax returns derived by adjusting the NIPA amounts to AGI concepts. This reconciliation is performed annually by the Bureau of Economic Analysis (BEA).

The results of the TCMP indicate that large amounts of income are not reported on tax returns as shown by the differences in columns 1 and 2. The differences for self-employment income are especially large.

The NIPA estimates used to evaluate the quality of the survey data differ from AGI income for five main reasons. First, the NIPA estimates include the income of

Table B-3. Comparison of Independent Sources of Income for 1987

(Billions of dollars)

Source	IRS AGI as reported	IRS AGI after TCMP adjust- ment	AGI after BEA reconcil- iation	NIPA adjusted to sur- vey concept
Wages and salary	2,163.9	2,239.8	2,238.9	2,215.9
Nonfarm self-employment ..	105.5	278.1	210.8	219.8
Farm self-employment	-1.3	10.5	39.9	48.9
Interest	¹ 169.0	186.4	178.7	244.4
Dividends	66.8	75.5	100.4	73.7
Net rents and royalties	-7.2	6.5	23.5	40.3
Pensions and annuities	² 124.8	147.1	164.6	125.8

¹Excludes \$31.0 in tax exempt interest not in AGI.

²Excludes \$47.9 in pensions and annuities not in AGI and an unknown amount of taxable lump-sum payments.

persons who are not required to file tax returns. Second, the NIPA estimates reflect both taxable and nontaxable income amounts. Third, the accounting methods used in the NIPA, such as the treatment of depreciation, differ from those used by the IRS. Fourth, the NIPA does not use individual income tax return data extensively in its estimation methodology because of concerns regarding high levels of misreporting. Fifth, some attempts have been made to adjust the NIPA estimates to exclude lump-sum payment, withdrawals, etc. that are sometimes included as income for tax purposes.

Appendix C. Source and Accuracy of Estimates

SOURCE OF DATA

The estimates in this report come from data obtained in March of years 1965 through 1991 in the Current Population Survey (CPS). The Bureau of the Census conducts the survey every month, although this report uses only March data for its estimates. The March survey uses two sets of questions, the basic CPS and the supplement.

Basic CPS. The basic CPS collects primarily labor force data about the civilian noninstitutional population. Interviewers ask questions concerning labor force participation about each member 15 years old and over in every sample household.

The present CPS sample was selected from the 1980 Decennial Census files with coverage in all 50 States and the District of Columbia. The sample is continually updated to account for new residential construction. It is located in 729 areas comprising 1,973 counties, independent cities, and minor civil divisions. About 60,000 occupied households are eligible for interview every month. Interviewers are unable to obtain interviews at about 2,600 of these units because the occupants are not home after repeated calls or are unavailable for some other reason.

Since the introduction of the CPS, the Bureau of the Census has redesigned the CPS sample several times to improve the quality and reliability of the data and to satisfy changing data needs. The most recent changes were completely implemented in July 1985.

The following table summarizes changes in the CPS designs for the years for which data appear in this report.

Description of March Current Population Survey

Time period	Number of sample areas	Housing units eligible ¹	
		Interviewed	Not interviewed
1990 to 1991	729	57,400	2,600
1989	729	53,600	2,500
1986 to 1988	729	57,000	2,500
1985	² 629/729	57,000	2,500
1982 to 1984	629	59,000	2,500
1980 to 1981	629	65,500	3,000
1977 to 1979	614	55,000	3,000
1973 to 1976	461	46,500	2,500
1972	449	45,000	2,000
1967 to 1971	449	48,000	2,000
1964 to 1966	357	33,500	1,500

¹Excludes about 2,500 Hispanic households added from the previous November sample. (See "March Supplement.")

²The CPS was redesigned following the 1980 Decennial Census of Population and Housing. During phase-in of the new design, housing units from the new and old designs were in the sample.

March Supplement. In addition to the basic CPS questions, interviewers asked supplementary questions in March about money income received the previous calendar year.

To obtain more reliable data for the Hispanic origin population, the March CPS sample was increased by adding eligible housing units, interviewed the previous November, that contained at least one sample person of Hispanic origin (the addition in March 1990 was approximately 2,500 eligible housing units). In addition, the sample included persons in the Armed Forces living off post or with their families on post.

Estimation Procedure. This survey's estimation procedure inflates weighted sample results to independent

estimates of the civilian noninstitutional population of the United States by age, sex, race and Hispanic/non-Hispanic categories. The independent estimates were based on statistics from decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the size of the Armed Forces. The independent population estimates used for 1981 (1980 for income estimates) to present were based on updates to controls established by the 1980 Decennial Census. Data previous to 1981 were based on independent population estimates from the most recent decennial census. For more details on the change in independent estimates, see the section entitled "Introduction of 1980 Census Population Controls" in an earlier report (Series P-60, No. 133). The estimation procedure for the March supplement included a further adjustment so husband and wife of a household received the same weight.

The estimates in this report for 1983 (from March 1984 CPS) and later also employ a revised survey weighting procedure for persons of Hispanic origin. In previous years, weighted sample results were inflated to independent estimates of the noninstitutional population by age, sex, and race. There was no specific control of the survey estimates for the Hispanic population. Since then, the Bureau of the Census developed independent population controls for the Hispanic population by sex and detailed age groups. Revised weighting procedures incorporate these new controls. The independent population estimates include some, but not all, undocumented immigrants.

ACCURACY OF ESTIMATES

Since the CPS estimates come from a sample, they may differ from figures from a complete census using the same questionnaires, instructions, and enumerators. A sample survey estimate has two possible types of error: nonsampling and sampling. The accuracy of an estimate depends on both types of error, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or on small differences between estimates. The standard errors for CPS estimates primarily indicate the magnitude of sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure systematic biases in the data. (Bias is the average over all possible samples of the differences between the sample estimates and the desired value.)

Nonsampling Variability. Nonsampling errors can be attributed to many sources. These sources include the inability to obtain information about all cases in the

sample, definitional difficulties, differences in the interpretation of questions, respondents' inability or unwillingness to provide correct information or to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

CPS undercoverage results from missed housing units and missed persons within sample households. Compared to the level of the 1980 Decennial Census, overall CPS undercoverage is about 7 percent. CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. As described previously, ratio estimation to independent age-sex-race-Hispanic population controls partially corrects for the bias due to undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Furthermore, the independent population controls have not been adjusted for undercoverage in the 1980 census.

Answers to questions about money income often depend on the memory or knowledge of one person in a household. Recall problems can cause underestimates of income in survey data, because it is easy to forget minor or irregular sources of income. Respondents may also misunderstand what the Census Bureau considers money income, or may simply be unwilling to answer these questions correctly because the questions are considered too personal. See appendix A for definitions and explanations.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey*, Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology*, Bureau of the Census, U.S. Department of Commerce.

Sampling Variability. Sampling variability is variation that occurred by chance because a sample was surveyed rather than the entire population. Standard errors, as calculated by methods described in "Standard Errors and Their Use," are primarily measures of sampling variability, although they may include some nonsampling error.

Comparability of Data. Data obtained from the CPS and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an

example of nonsampling variability not reflected in the standard errors. Use caution when comparing results from different sources.

Caution should also be used when comparing estimates, which reflect 1980 census-based population controls, with estimates for 1979 (from March 1980 CPS) and earlier years, which reflect census-based population controls derived from previous decennial censuses. This change in population controls had relatively little impact on summary measures such as means, medians, and percentage distributions, but did have a significant impact on levels. For example, use of 1980 based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for data collected in 1981 and later years will differ from those for earlier years by more than what could be attributed to actual changes in the population. These differences could be disproportionately greater for certain subpopulation groups than for the total population.

Since no independent population control totals for persons of Hispanic origin were used before 1983, compare Hispanic estimates over time cautiously.

A number of changes were made in data collection and estimation procedures beginning with the March 1980 CPS. The major changes were the use of a more detailed income questionnaire, the use of the "householder" concept, the introduction of the new farm definition, and use of more detailed income intervals in the upper range of the income distribution. Due to these and other changes, one should use caution when comparing estimates for 1979 through 1990 with estimates for earlier years. A description of these changes and the effect they had on the data is given in the section "Modifications to the March 1980 CPS" of an earlier report (Series P-60, No. 129).

Another major change is that income estimates for 1985 are the first based entirely on households selected from the 1980 census-based sample design. Estimates by type of residence category such as metropolitan, nonmetropolitan, farm and nonfarm, which were omitted from the 1984 report because of the mixed 1970 and 1980 census sampling frame used for the March 1985 CPS, have been resumed. The residence categories reflect metropolitan areas defined as of June 1984. In addition, the March 1986 supplement questionnaire was revised to enable the coding of higher amounts of earnings from longest job.

Note When Using Small Estimates. Summary measures (such as medians and percentage distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, summary measures would probably not reveal useful information when computed on a smaller base. However, estimated numbers are shown even though the relative standard

errors of these numbers are larger than those for corresponding percentages. These smaller estimates permit combinations of the categories to suit data users' needs. Take care in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Standard Errors and Their Use. A number of approximations are required to derive, at a moderate cost, standard errors applicable to all the estimates in this report. Instead of providing an individual standard error for each estimate, a and b parameters are provided for various types of characteristics. These parameters are listed in tables C-1 through C-6. Table C-7 lists the year-to-year correlation coefficients for poverty and income characteristics.

The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result of all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.645 standard errors below the estimate to 1.645 standard errors above the estimate would include the average result of all possible samples.

A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples.

Some statements in the report may contain estimates followed by a number in parentheses. This number can be added to and subtracted from the estimate to calculate upper and lower bounds of the 90-percent confidence interval. For example, if a statement contains the phrase "grew by 1.7 percent (± 1.0)," the 90-percent confidence interval for the estimate, 1.7 percent, is 0.7 percent to 2.7 percent.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the percentage of male workers with low annual earnings to the percentage of female workers with low annual earnings.

Tests may be performed at various levels of significance, where a significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better. This means that the absolute

value of the estimated difference between characteristics is greater than or equal to 1.645 times the standard error of the difference.

Standard Errors of Estimated Numbers. The approximate standard error, s_x , of an estimated number shown in this report can be obtained by using the formula

$$s_x = \sqrt{ax^2 + bx} \quad (1)$$

Here x is the size of the estimate and a and b are the parameters in tables C-1 through C-6 associated with the particular type of characteristic. When calculating standard errors for numbers from cross-tabulations involving different characteristics, use the set of parameters for the characteristic which will give the largest standard error.

Illustration

Table B shows that there were 55,536,000 total workers with low annual earnings in 1990. Using formula (1) with $a = -0.000012$ and $b = 2,254$ from table C-1, the approximate standard error of 55,536,000 is

$$s_x = \sqrt{-0.000012 \times 55,536,000^2 + 2,254 \times 55,536,000} = 297,000$$

The 90-percent confidence interval for the estimated number of total workers with low annual earnings in 1990 is from 55,047,000 to 56,025,000, i.e., 55,536,000 $\pm$ 1.645(297,000).

Standard Errors of Estimated Percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the parameter from tables C-1 through C-6 indicated by the numerator.

The approximate standard error, $s_{x,p}$, of an estimated percentage can be obtained by use of the formula

$$s_{x,p} = \sqrt{\frac{b}{x} p(100 - p)} \quad (2)$$

Here x is the total number of persons, families, households, or unrelated individuals which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in tables C-1 through C-6 associated with the characteristic in the numerator of the percentage.

Illustration

Table B shows that 14,440,000 or 18.0 percent of the 80,035,000 year-round, full-time workers had low annual earnings in 1990. Using formula (2) with $b = 2,254$ from table C-1, the approximate standard error of 18.0 percent is

$$s_{x,p} = \sqrt{\frac{2,254}{80,035,000} (18.0) (100.0 - 18.0)} = 0.2$$

The 90-percent confidence interval for the estimated percentage of year-round, full-time workers with low annual earnings in 1990 is from 17.7 percent to 18.3 percent, i.e., 18.0 $\pm$ 1.645(0.2).

Standard Error of a Difference. The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2 - 2rs_xs_y} \quad (3)$$

where s_x and s_y are the standard errors of the estimates, x and y . The estimates can be numbers, percentages, ratios, etc. The correlation coefficient, r , can be determined from table C-7 for year-to-year comparisons for poverty or income estimates of numbers and proportions; for other comparisons assume that r equals zero. This will represent the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration

Table B shows that 13.9 percent of the 48,354,000 male year-round, full-time workers had low annual earnings in 1990 and 24.3 percent of the 31,681,000 female year-round full-time workers had low annual earnings in 1990. The apparent difference is 10.4 percent. Using formula (2) with $b = 2,254$ from table C-1, the standard error, s_x , of 13.9 percent is 0.2. Similarly, the standard error, s_y , of 24.3 percent is 0.4.

Using formula (3), the approximate standard error of 10.4 is

$$s_{x-y} = \sqrt{0.2^2 + 0.4^2} = 0.4$$

The 90-percent confidence interval for the estimated difference of the percentage of male and female year-round, full-time workers with low incomes in 1990 is

from 9.7 to 11.1, i.e., $10.4 \pm 1.645(0.4)$. Because this interval does not contain zero, we can conclude with 90-percent confidence that the percentage of male

year-round, full-time workers with low earnings was larger than the percentage of female year-round, full-time workers with low earnings in 1990.

Table C-1. Standard Error Parameters for Income and Nonincome Characteristics: 1989 and 1990

Characteristics	Total or White		Black		Hispanic	
	a	b	a	b	a	b

Marital Status:				
Persons	-0.000019	3,602	-0.000213	5,166
Families	-0.000008	1,429	-0.000053	1,292

Note: For regional estimates multiply the a and b parameters by 1.03, 1.04, 1.09, and 0.93 for Northeast, Midwest, South, and West, respectively. Multiply by 1.5 for nonmetropolitan residence categories.

Table C-7. Year-To-Year Correlation Coefficients For Poverty and Income Estimates: 1989 and 1990

Characteristics	Below poverty level		All income levels	
	Persons	Families	Persons	Families
Total	0.45	0.35	0.30	0.35
White	0.35	0.30	0.30	0.35
Black	0.45	0.35	0.30	0.35
Other Races	0.45	0.35	0.30	0.35
Hispanic ¹	0.65	0.55	0.45	0.55

¹Persons of Hispanic origin may be of any race.

Note: These correlations are for comparisons of consecutive years. For comparisons of nonconsecutive years, assume the correlations are zero.

Each March, the Census Bureau also collects information about the economic situation of Americans and their families for the previous year. I am going to ask these questions now. We don't expect all answers to be perfect, but please think about each question and answer it the best you can.																																													
12. TYPE INTERVIEW (CPS-665) ☐ Personal (Fill 13A below) ☐ Telephone ☐ Type A Noninterview (Transcribe items 1, 3, 6-10, 77 on this page; also, ask from 78 on this page)	13A. DESCRIPTION OF LONGEST JOB (Items 46A-E) IN THIS CPS-665: Yes ☐ No ☐																																													
77. CHECK ITEM TENURE (from Control Card item 10) Owned or being bought 1 Rented 2 No cash rent 3	83. During 1990, how many of the children in this household usually ate a complete hot lunch offered at school? ☐ All ☐ Some, but not all - Mark number 1 2 3 4 5 6 7 8 9 ☐ None	85. Are you paying lower rent because the Federal, State, or local government is paying part of the cost? Yes ☐ No ☐																																												
78. How many housing units are in this structure? 1 ☐ 5-9 ☐ 2 ☐ 10+ ☐ 3-4 ☐	84. CHECK ITEM Entry in Control Card Item 29 is: Under \$30,000, NA, or Ref. ☐ (Fill 85) \$30,000 or more ☐ End questions	86. Did anyone in this household get food stamps at any time during 1990? Yes ☐ (Ask 91) No ☐ (Skip to 94)																																												
79. CHECK ITEM Some household members under age 15 ☐ (Ask 80) No household members under age 15 ☐ (Skip to 82)	86. CHECK ITEM All or some marked in 83 ☐ (Ask 86) None marked in 83 or 83 blank ☐ (Skip to 87)	87. How many of the people now living here were covered by food stamps during 1990? 1 2 3 4 5 6 7 8 9 All ☐																																												
80. During 1990, how many of the children under age 15 in this household were covered by Medicare or Medicaid? ☐ All ☐ Some, but not all - Mark number 1 2 3 4 5 6 7 8 9 ☐ None	88. During 1990, how many of the children in this household received free or reduced price lunches because they qualified for the Federal School Lunch Program? ☐ All ☐ Some, but not all - Mark number 1 2 3 4 5 6 7 8 9 ☐ None	89. In how many months of 1990 were food stamps received? 0 1 1 1 2 2 3 3 4 4 5 5 6 6 7 7 8 8 9 9 All ☐																																												
81. During 1990, how many of the children under age 15 in this household were covered by a health insurance plan (Excluding Medicaid and Medicare)? ☐ All ☐ Some, but not all - Mark number (Ask 81A) 1 2 3 4 5 6 7 8 9 ☐ None (Skip to 82)	87. CHECK ITEM Owned marked in 77 ☐ (Skip to 90) Rented or no cash rent marked in 77 ☐ (Ask 88)	90. What was the value of all the food stamps received during 1990? (Add monthly amounts to obtain annual figure) 0 0 0 0 1 1 1 1 2 2 2 2 3 3 3 3 4 4 4 4 5 5 5 5 6 6 6 6 7 7 7 7 8 8 8 8 9 9 9 9 (Ask 94)																																												
81A. How many of these children were covered by the health insurance plan of someone not residing in this household? ☐ All ☐ Some, but not all - Mark number 1 2 3 4 5 6 7 8 9 ☐ None	88. Is this house in a public housing project, that is, is it owned by a local housing authority or other public agency? Yes ☐ (Skip to 90) No ☐ (Ask 89)	91. The government has an energy assistance program which helps pay heating costs. This assistance can be received directly by the household or it can be paid directly to the electric company, gas company or fuel dealer. Since October 1, 1990, has this household received assistance of this type from the federal, state, or local government? Yes ☐ (Ask 95) No ☐ (End questions)																																												
82. CHECK ITEM Some household members 5-10 years old ☐ (Ask 83) No household members 5-18 years old ☐ (Skip to 84)	95. Altogether, how much energy assistance has been received since October 1, 1990? 0 0 0 0 1 1 1 1 2 2 2 2 3 3 3 3 4 4 4 4 5 5 5 5 6 6 6 6 7 7 7 7 8 8 8 8 9 9 9 9																																													

FOLLOW-UP INFORMATION - TRANSCRIBE THIS INFORMATION FROM THE CPS-1
AND CONTROL CARD BEFORE SENDING THEM TO THE R.O.

ALL CPS-1s AND CONTROL CARDS MUST BE SENT TO THE R.O. BY SATURDAY, MARCH 23

ALL 689s MUST BE MAILED TO R.O. BY SATURDAY, MARCH 30

- (1) Complete items 3, 6-9, 77, 79, 82 and 84 on page 1.
- (2) Complete items 18A, 18B, 18D, and 18G1 for each 15+ person, (p. 3, 4, 5, 6).
- (3) Record below the industry and occupation description from CPS-1 items 23A-23E as applicable.
You will need to refer to it when filling item 45 in your followup interview.
- (4) Complete items 56D and 56, (p. 7 and 8, respectively).
- (5) Note below Names and Line No.'s of persons (and item numbers, if necessary) reading followup.
Also, as necessary note address, telephone, and "best time to call" information from control card.

NOTES:

COMPLETE LINE NUMBER FOR ALL PERSONS 13+ BEFORE BEGINNING QUESTIONS ON EACH PAGE (NAME IS OPTIONAL)				
NAME (Optional)	Page 3	Page 4	Page 5	Page 6
LINE NUMBER (Row 18A)
